

The Best Defense Against Evaporative Cooler Scale

Cooler Guard is a 30-day time-release treatment that prevents and dissolves scale on evaporative cooler pads. It allows the system to run with the bleed-off valve turned off, offering significant water

SAVE PADS | SAVE WATER | SAVE TIME & MONEY

Place Cooler Guard in the reservoir and let it do all the work to keep cooler pads clean and efficient.

Why Choose Cooler Guard?

- Unique, proprietary blend of cleaning and descaling agents.
- Replace in drain basin every 30 days until built up scale crumbles like sand
- To prevent new scale build up, insert 1-3 times during the season
- Puts mineral scale in suspension so it won't stick to the cell pads
- Will not damage cell pads or equipment
- Saves water

Cooler Guard offers superior performance by design. Cooler Guard emits time-release cleaners, descaling agents, and dispersants into the sump water, which is then circulated by the units' pump. It is effective at dissolving current scale as well as guarding against future scale deposits. Cooler Guard keeps scale in suspension and cooler pads effective.

Cooler Guard enables you to close your bleed-off valve. It's only necessary to drain the sump water and replace Cooler Guard every 30 days. Discharging just 1 gallon of water per minute from your cooler can lead to a daily loss of over 1,400 gallons, significantly increasing costs. Cooler Guard offers significant water savings, and only requires a few minutes of monthly maintenance.

30 Day Treatment works on all evaporative coolers, from barns to portable units
